

I have been using GPS technology since it was first made available to the public, in the air, land and seas. I have a substantial investment in GPS mapping and navigation equipment.

From what has been publicly disclosed, the tests of proposed LightSquared Network appear to cause substantial interference with just about every GPS receiver in the vicinity of the tests, and some receivers out to a substantial distance. To allow LightSquared to proceed with its plans to use the spectrum adjacent to the GPS signal is shortsighted and extremely expensive to many groups of users (public, private, military and government) who have invested and depend on this technology for a wide variety of uses. The thought of allowing an FCC licensed signal to interfere with navigation and mapping that affects public safety in sooooo many ways, is just ridiculous.

Please, do NOT permit the LightSquared plan to proceed as proposed. Find another piece of spectrum that does not interfere with current established uses!
